SYLLABUS

Web Programming Laboratory

1. Develop and demonstrate a HTML file that includes Javascript script for the following problems:

a) Input: A number n obtained using prompt

Output: The first n Fibonacci numbers

b) Input: A number n obtained using prompt

Output: A table of numbers from 1 to n and their squares using **alert**

2. a) Develop and demonstrate, using Javascript script, a HTML document that collects the USN (the valid format is: A digit from 1 to 4 followed by two upper-case characters followed by two digits followed by two upper-case characters followed by three digits; no embedded spaces allowed) of the user. Event handler must be included for the form element that collects this information to validate the input. Messages in the alert windows must be produced when errors are detected.

b) Modify the above program to get the current semester also (restricted to be a number from 1 to 8)

3. a) Develop and demonstrate, using Javascript script, a HTML document that contains three short paragraphs of text, stacked on top of each other, with only enough of each showing so that the mouse cursor can be placed over some part of them. When the cursor is placed over the exposed part of any paragraph, it should rise to the top to become completely visible.

b) Modify the above document so that when a paragraph is moved from the top stacking position, it returns to its original position rather than to the bottom.

4. a) Design an XML document to store information about a student in an engineering college affiliated to VTU. The information must include 100 USN, Name, Name of the College, Branch, Year of Joining, and e-mail id. Make up sample data for 3 students. Create a CSS style sheet and use it to display the document.

b) Create an XSLT style sheet for one student element of the above document and use it to create a display of that element.

5. a) Write a Perl program to display various Server Information like Server Name, Server Software, Server protocol, CGI Revision etc.

b) Write a Perl program to accept UNIX command from a HTML form and to display the output of the command executed.

6. a) Write a Perl program to accept the User Name and display a greeting message randomly chosen from a list of 4 greeting messages.

- b) Write a Perl program to keep track of the number of visitors visiting the web page and to display this count of visitors, with proper headings.
7. Write a Perl program to display a digital clock which displays the current time of the server.
 8. Write a Perl program to insert name and age information entered by the user into a table created using MySQL and to display the current contents of this table.
 9. Write a PHP program to store current date-time in a COOKIE and display the 'Last visited on' date-time on the web page upon reopening of the same page.
 10. Write a PHP program to store page views count in SESSION, to increment the count on each refresh, and to show the count on web page.
 11. Create a HTML form with Name, Address Line 1, Address Line 2, and E-mail text fields. On submitting, store the values in MySQL table. Retrieve and display the data based on Name.
 12. Build a Rails application to accept book information viz. Accession number, title, authors, edition and publisher from a web page and store the information in a database and to search for a book with the title specified by the user and to display the search results with proper headings.

COURSE OBJECTIVE

The course will enable students to

- Understand the importance of the web as a medium of communication.
- Understand the principles of creating an effective web page, including an in-depth consideration of information architecture.
- Develop skills in analyzing the usability of a web site.
- Learn the language of the web: HTML and CSS.
- Be able to embed social media content into web pages.
- Implement and understand how to interpret basic web analytics.
- Use JavaScript to access and use web services for dynamic content

COURSE OUTCOME

After studying this course, students will be able to:

- Use Javascript and XHTML to create web pages with advanced interactivity
 - Program basic functions in Javascript and HTML
 - Use javascript to create functional forms
 - Us Javasript to control browser frames and windows
 - Use cascading style sheets to dsign web pages
-

LIST OF EXPERIMENTS

Sl No	Title	Page no.
1.	<p>Develop and demonstrate a XHTML file that includes Javascript script for the following problems:</p> <p>a) Input: A number n obtained using prompt Output: The first n Fibonacci numbers</p> <p>b) Input: A number n obtained using prompt Output: A table of numbers from 1 to n and their squares using alert</p>	10- 15
2.	<p>a) Develop and demonstrate, using Javascript script, a XHTML document that collects the USN (the valid format is: A digit from 1 to 4 followed by two upper-case characters followed by two digits followed by two upper-case characters followed by three digits; no embedded spaces allowed) of the user. Event handler must be included for the form element that collects this information to validate the input. Messages in the alert windows must be produced when errors are detected.</p> <p>b) Modify the above program to get the current semester also (restricted to be a number from 1 to 8)</p>	16- 21
3.	<p>a) Develop and demonstrate, using Javascript script, a XHTML document that contains three short paragraphs of text, stacked on top of each other, with only enough of each showing so that the mouse cursor can be placed over some part of them. When the cursor is placed over the exposed part of any paragraph, it should rise to the top to become completely visible.</p> <p>b) Modify the above document so that when a paragraph is moved from the top stacking position, it returns to its original position rather than to the bottom.</p>	22-26
4.	<p>a) Design an XML document to store information about a student in an engineering college affiliated to VTU. The information must include USN, Name, and Name of the College, Brach, Year of Joining, and e-mail id. Make up sample data for 3 students. Create a CSS style sheet and use it to display the document.</p> <p>b) Create an XSLT style sheet for one student element of the above document and use it to create a display of that element.</p>	27- 31

5.	<p>a) Write a Perl program to display various Server Information like Server Name, Server Software, Server protocol, CGI Revision etc.</p> <p>b) Write a Perl program to accept UNIX command from a HTML form and to display the output of the command executed.</p>	32- 35
6.	<p>a) Write a Perl program to accept the User Name and display a greeting message randomly chosen from a list of 4 greeting messages.</p> <p>b) Write a Perl program to keep track of the number of visitors visiting the web page and to display this count of visitors, with proper headings.</p>	36-38
7.	Write a Perl program to display a digital clock which displays the current time of the server.	39
8.	Write a Perl program to insert name and age information entered by the user into a table created using MySQL and to display the current contents of this table.	40-42
9.	Write a PHP program to store current date-time in a COOKIE and display the 'Last visited on' date-time on the web page upon reopening of the same page.	43-44
10.	Write a PHP program to store page views count in SESSION, to increment the count on each refresh, and to show the count on web page.	45-46
11.	Create a XHTML form with Name, Address Line 1, Address Line 2, and E-mail text fields. On submitting, store the values in MySQL table. Retrieve and display the data based on Name.	47- 52
12.	Build a Rails application to accept book information viz. Accession number, title, authors, edition and publisher from a web page and store the information in a database and to search for a book with the title specified by the user and to display the search results with proper headings.	62

EXPERIMENT NO. 1(a)

AIM: To display Fibonacci series using Javascript

PROGRAM:

```
<html >

<head>

    <title>Fibonacci Series</title>

</head>

<body>

    <script type="text/javascript">

        var fib1=0,fib2=1,fib=0;

        var num=prompt("Enter a number : \n", "");

        if(num != null && num > 0 )

        {

            document.write("<h1>The first "+num+" numbers in the fibonacci series

</h1>");

            if(num==1)

                document.write("<h2> "+ fib1 + "</h2>");

            else

            {

                document.write("<h2>" + fib1 + "</h2>");

                document.write("<h2>" + fib2 + "</h2>");

            }

            for(i=3;i<=num; i++)
```

```
        {  
            fib= fib1 + fib2;  
            document.write("<h2> " + fib + "</h2>");  
            fib1=fib2;  
            fib2=fib;  
        }  
    }  
else  
    alert("Invalid Input");  
  
</script>  
  
</body>  
  
</html>
```

SAMPLE OUTPUT

EXPERIMENT NO. 1(b)

PROGRAM:

AIM: To display the square of a given numbers using Javascript

```
<html >
```

```
<head>
```

```
<title>Number and its squares</title>
```

```
</head>
```

```
<body>
```

```
<script type="text/javascript">
```

```
var num = prompt("Enter a number : \n", "");
```

```
var msgstr;
```

```
if(num > 0 && num !=null){
```

```
    msgstr="Number and its Squares are \n";
```

```
    for(i=1;i <= num; i++)
```

```
    {
```

```
        msgstr = msgstr + i + " ^ 2 = " + i*i + "\n";
```

```
    }
```

```
    alert(msgstr);
```

```
}
```

```
else
```

```
alert("Invalid Input");
```

```
</script>
```

```
</body>
```

```
</html>
```

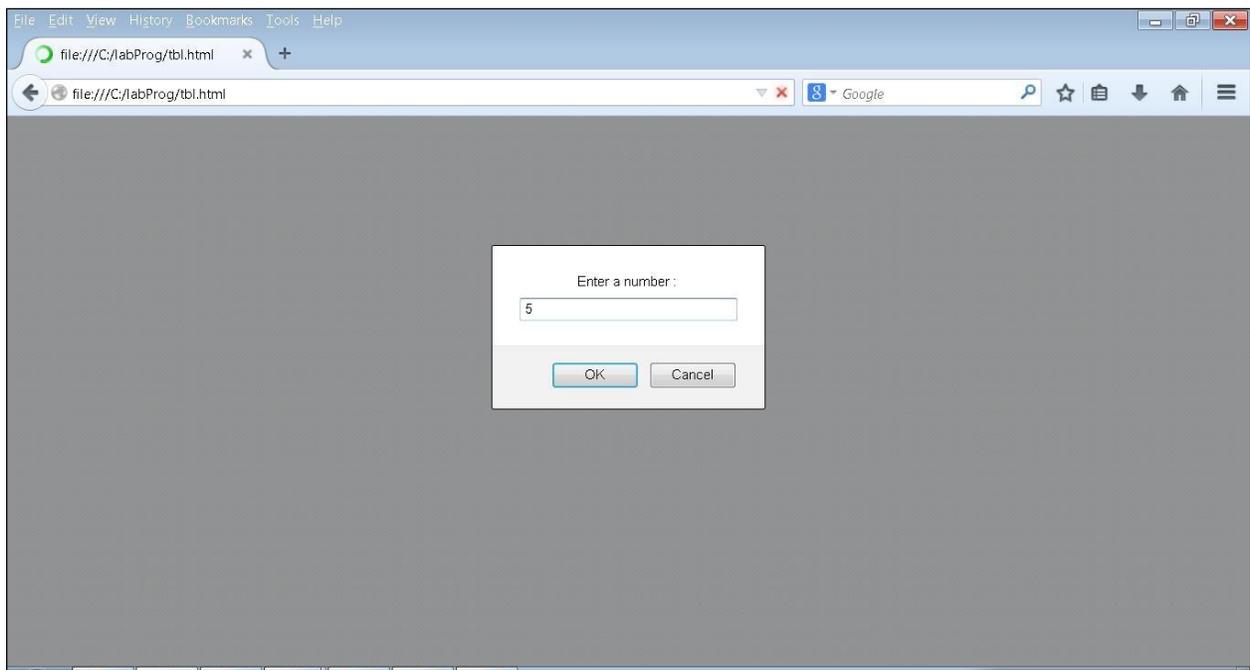

Note:

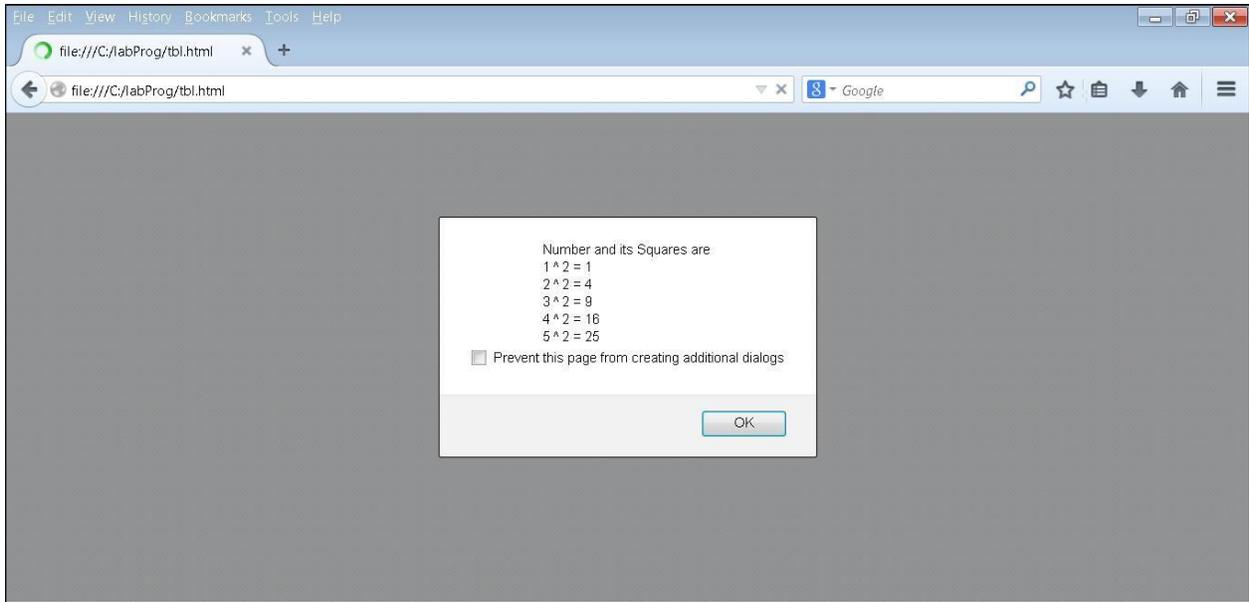

The `\u00B2` character displays superscript 2 in the javascript boxes.

Code:

```
msgstr = msgstr + i + "\u00B2 = " + i*i + "\n";
```

SAMPLE OUTPUT

EXPERIMENT NO. 2(a)

AIM: To validate the USN of the student and to print them

PROGRAM:

```
<html >

<head>

<title> USN validator </title>

<script type="text/javascript">

    function formValidator()

    {

        var usn = document.getElementById('usnFrm');

        usnExp=/[1-4][A-Z][A-Z]\d{2}[A-Z][A-Z]\d{3}$/

        if(usn.value.length==0)

        {

            alert("USN is empty.");

            usn.focus();

            return false;

        }

        else if(!usn.value.match(usnExp))

        {

            alert("USNshouldbein VTUUSNformat, eg.,1GD10CS001");
```

```
        usn.focus();
        return false;
    }

    alert("USN: "+usn.value+" is in correct format");
    return true;
}
</script>
</head>
<body>
    <form onSubmit = "formValidator()">
        Enteryour VTUUSN:<inputtype="text" id="usnFrm"/>
        <br />
        <input type ="submit" value="SUBMIT"/>
    </form>
</body>
</html>
```

SAMPLE OUTPUT

EXPERIMENT No.2(b)

PROGRAM: To display the current semester

```
<html >
<head>
  <title> USN validator </title>

  <script type="text/javascript">
    function formValidator()
    {
      var usn = document.getElementById('usnFrm');
      var sem = document.getElementById('semFrm');

      usnExp=/[1-4][A-Z][A-Z]\d{2}[A-Z][A-Z]\d{3}$/
      semExp=/^[1-8]$/

      if(usn.value.length==0)
      {
        alert("USN is empty.");
        usn.focus();
        return false;
      }
      else if(!usn.value.match(usnExp))
```

```

    {
        alert("USN should be in VTUUSN format, eg., 1GD10CS001");
        usn.focus();
        return false;
    }
    else if(sem.value.length==0)
    {
        alert("Semester field is empty.");
        sem.focus();
        return false;
    }
    else if(!sem.value.match(semExp))
    {
        alert("Semester number should be from 1 to 8");
        sem.focus();
        return false;
    }
    alert("USN: "+usn.value+"\n Semester: "+sem.value);
    return true;
}
</script>
</head>
<body>
<h1>Form validation using javascript</h1>
<form onSubmit = "formValidator()">
    <p>Enter your VTUUSN: <input type="text" id="usnFrm"/>
    </p>
    <p>Enter your current semester: <input type="text" id="semFrm"/>
    </p>
    <input type="submit" value="SUBMIT"/>
</form>
</body>
</html>

```

SAMPLE OUTPUT

EXPERIMENT No.3(a)

AIM: To display the stacking of elements

```
<html >
  <head>
    <title>Paragraph Stacking </title>

    <style type="text/css">
      .para

SAMPLE OUTPUT

The image shows a web browser window with the address bar containing the file path: file:///C:/labProg/studDetails.xml. The browser's menu bar includes File, Edit, View, History, Bookmarks, Tools, and Help. The search engine is set to Google. The main content area displays the title "VTU Student Details" above a table with the following data:

USN	Name	College	Branch	Year	Email ID
1MJ11CS001	Arun Kumar	MVJ College of Engineering	Computer Science and Engineering	2011	arunk@gmail.com
1MJ10ME012	Swaroop J	MVJ College of Engineering	Mechanical Engineering	2010	swaroopj@gmail.com
1MJ12AE030	Pradeep L	MVJ College of Engineering	Aeronautical Engineering	2012	spradeep@gmail.com

Experiment No.5 a

AIM : To display server information using Perl Programming

```
#!/usr/bin/perl -w

use CGI qw(:standard);
use CGI::Carp qw(warningsToBrowser fatalsToBrowser);

print "content-
type:text/html","\n\n"; print
"<html>\n";
print "<head> <title> About this server </title> </head>\n";
print "<body><h1> About this server </h1>","\n";
print "<p> Thisinformation issent byweb serverto everyCGIprogram.";

print "<hr />";
print "Server name : ",$ENV{'SERVER_NAME'},"<br />";
print "Running on port : ",$ENV{'SERVER_PORT'},"<br />";
print "Server Software : ",$ENV{'SERVER_SOFTWARE'},"<br />";
print "CGI-Revision : ",$ENV{'GATEWAY_INTERFACE'},"<br />";

print "RootDirectoryof Server: ",$ENV{'DOCUMENT_ROOT'},"<br/>";
print "Browser Type : ",$ENV{'HTTP_USER_AGENT'},"<br />";
print "FullpathnameofcurrentCGI: ",$ENV{'SCRIPT_FILENAME'},"<br/>";
print "<hr />\n";
print "</body></html>\n";
exit(0);
```

SAMPLE OUTPUT

EXPERIMENT No.5(b)

AIM : To execute UNIX commands and to display the output

b) Write a Perl program to accept UNIX command from a HTML form and to display the output of the command executed.

1. cmd.html

```
<html>
<head>
  <title>Execute UNIX Command </title>
</head>

<body>
  <h3> Execute a UNIX Command </h3></title>
  <form action="http://localhost/cgi-bin/cmd.pl" method="GET">
    Enter a UNIX command : <input type="text" name="com" />
    <input type="submit" value="Execute Command" />
  </form>
</body>
</html>
```

2. cmd.pl (Store in /var/www/cgi-bin directory, change permissions using chmod 777 cmd.pl)

```
#!/usr/bin/perl -w
```

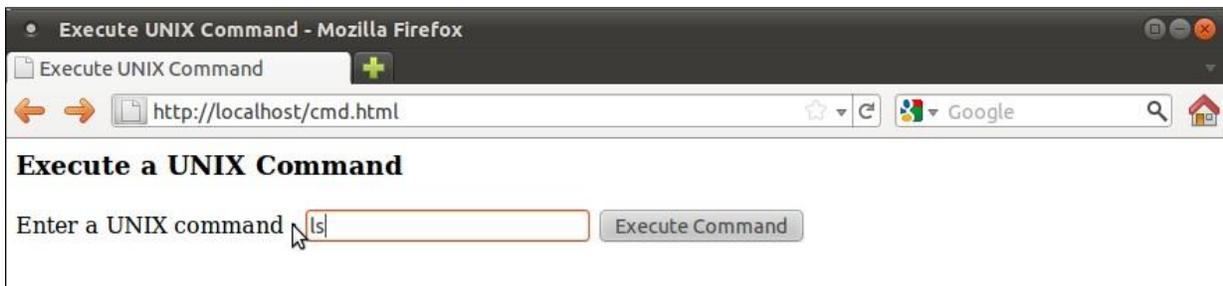

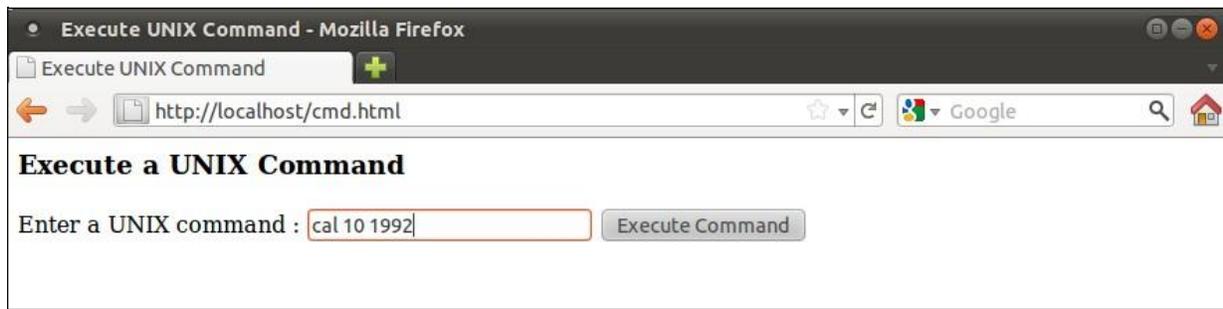

```
use CGI qw(:standard);
use CGI::Carp qw(warningsToBrowser fatalsToBrowser);

print "content-type: text/html \n\n";
print "<html>\n";

```

SAMPLE OUTPUT

The screenshot shows a Mozilla Firefox browser window titled "User Details Form - Mozilla Firefox". The address bar displays "http://localhost/userForm.html". The page content is on a light green background and features the heading "User Details" in bold green text. Below the heading are three input fields: "First Name" with the value "Sneha", "Last Name" with the value "L", and "Age" with the value "20". A "SUBMIT" button is positioned below the "Age" field.

The screenshot shows a Mozilla Firefox browser window titled "Display User Details - Mozilla Firefox". The address bar displays "http://localhost/cgi-bin/display.pl?fname=Swetha&lname=Bhaskar&a". The page content is on a light pink background and features the heading "User Details" in bold purple text. Below the heading is a blue link "Enter user details". A table with three columns and two rows of data is displayed below the link.

	FIRST NAME	LAST NAME	AGE
1	Arun	Kumar	20
2	Swetha	Bhaskar	19

SAMPLE OUTPUT

AIM: To display the book information using Rails

Software used: xampp server, Instantrails2.0

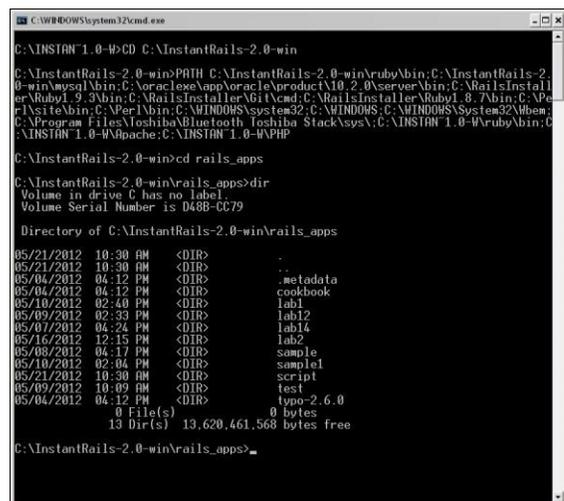

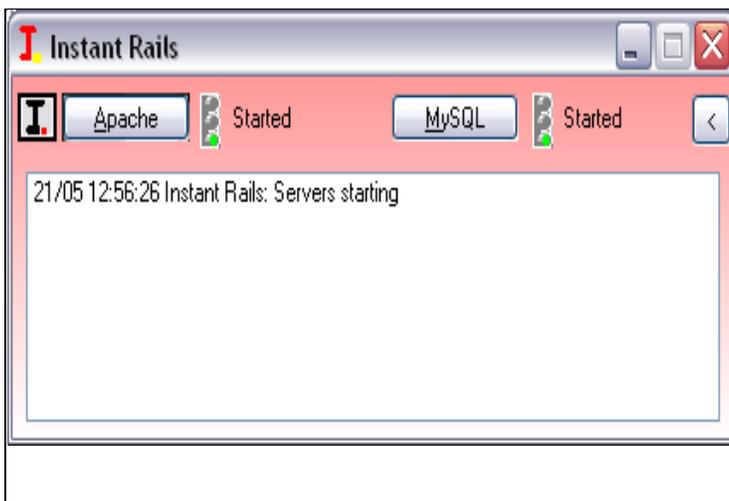

Save instantrails2.0 in c:/

Start xampp

- o Goto C:\Instantrails2.0 there will be an icon **I**, double click on that.

Click on I (left side)- Rails applications → ruby console window

1. Create Database

Type this code at command prompt to login to mysql server as root and get the mysql prompt

```
> mysql -u root
```

```
mysql> create database bookApp_development;
```

```
mysql> create database bookApp_test;
```

```
mysql> create database bookApp_production;
```

```
mysql> use bookApp_development;
```

```
mysql> create table books
```

```
(ID INT NOT NULL AUTO_INCREMENT,
```

```
acc_num int NOT NULL,
```

```
title VARCHAR(150) NOT NULL,
```

```
authors VARCHAR(150) NOT NULL,
```

```
edition INT(2),
```

```
publisher VARCHAR(150),
```

```
PRIMARY KEY(ID)
```

```
);
```

Quit MySQL by typing

```
mysql> quit;
```

2. Generate the ruby script

```
C:\InstantRails-2.0-win\rails_apps> rails -d mysql bookApp
```

```
C:\InstantRails-2.0-win\rails_apps> cd bookApp
```

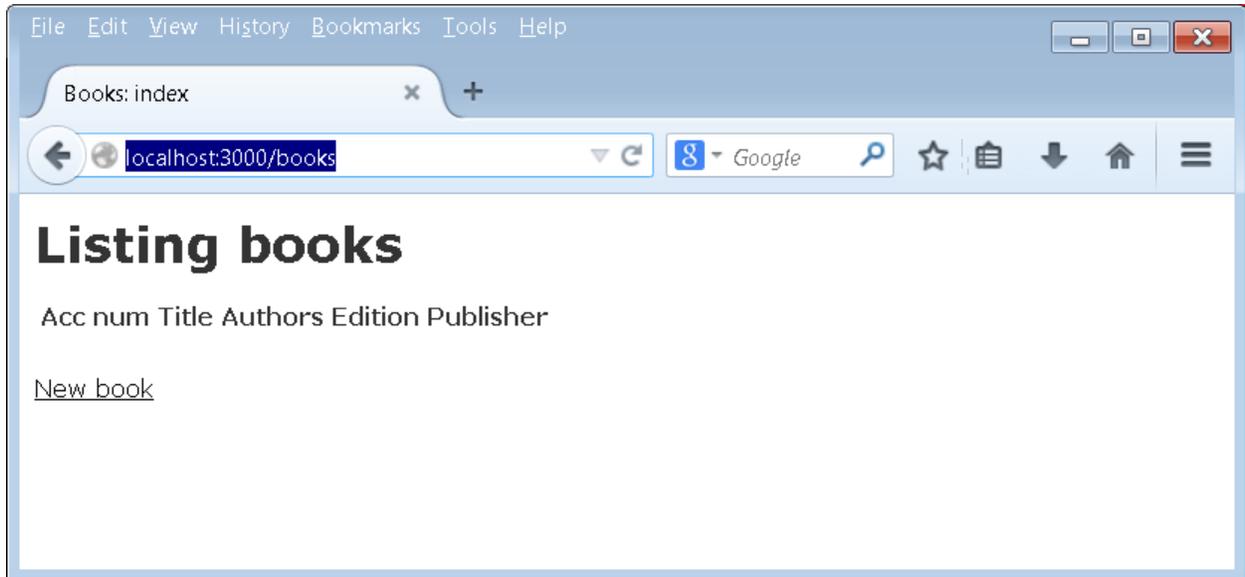

```
C:\InstantRails-2.0-win\rails_apps\bookApp> ruby script/generate scaffold Book ac
```

```
c_num:int title:string authors:string, edition:int publisher:string
```

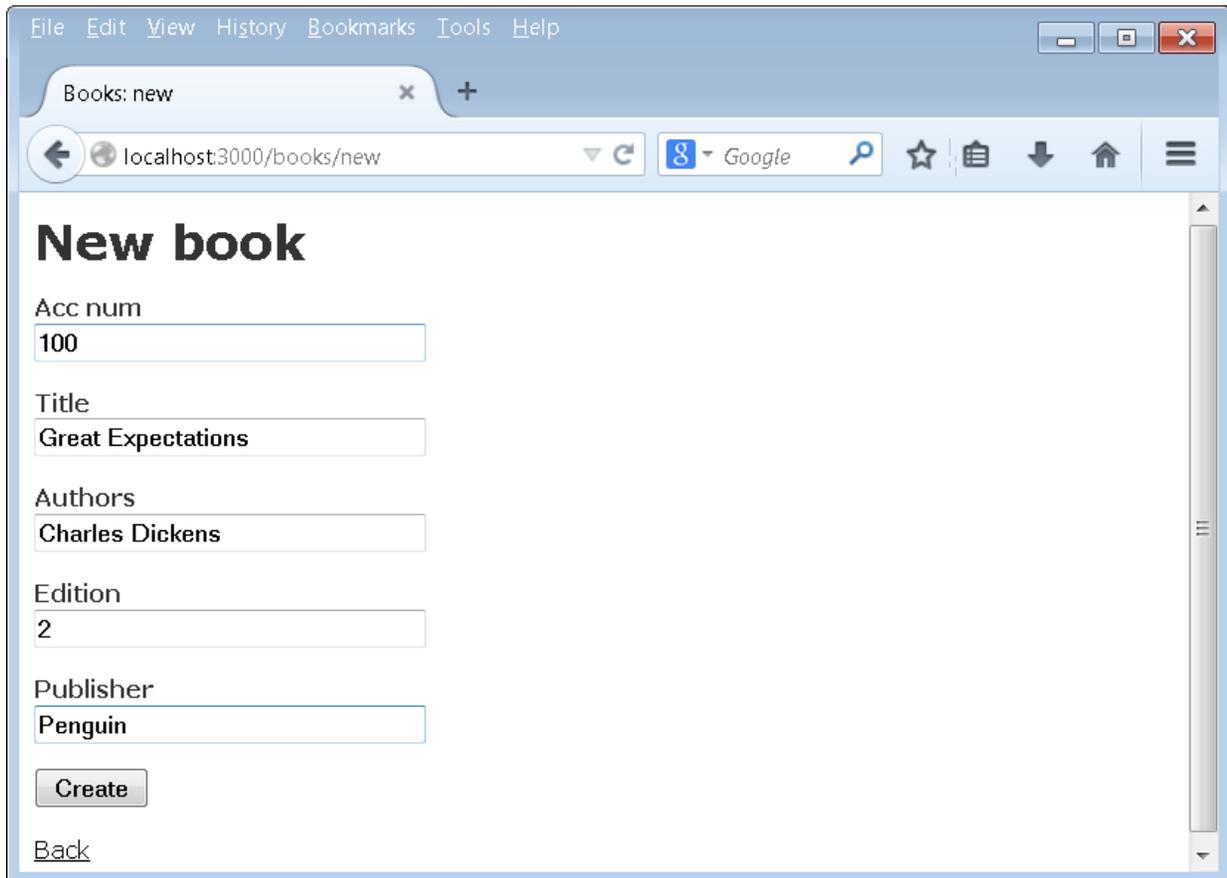

Start the application with mongrel

```
C:\InstantRails-2.0-win\rails_apps\bookApp> ruby script/server
```

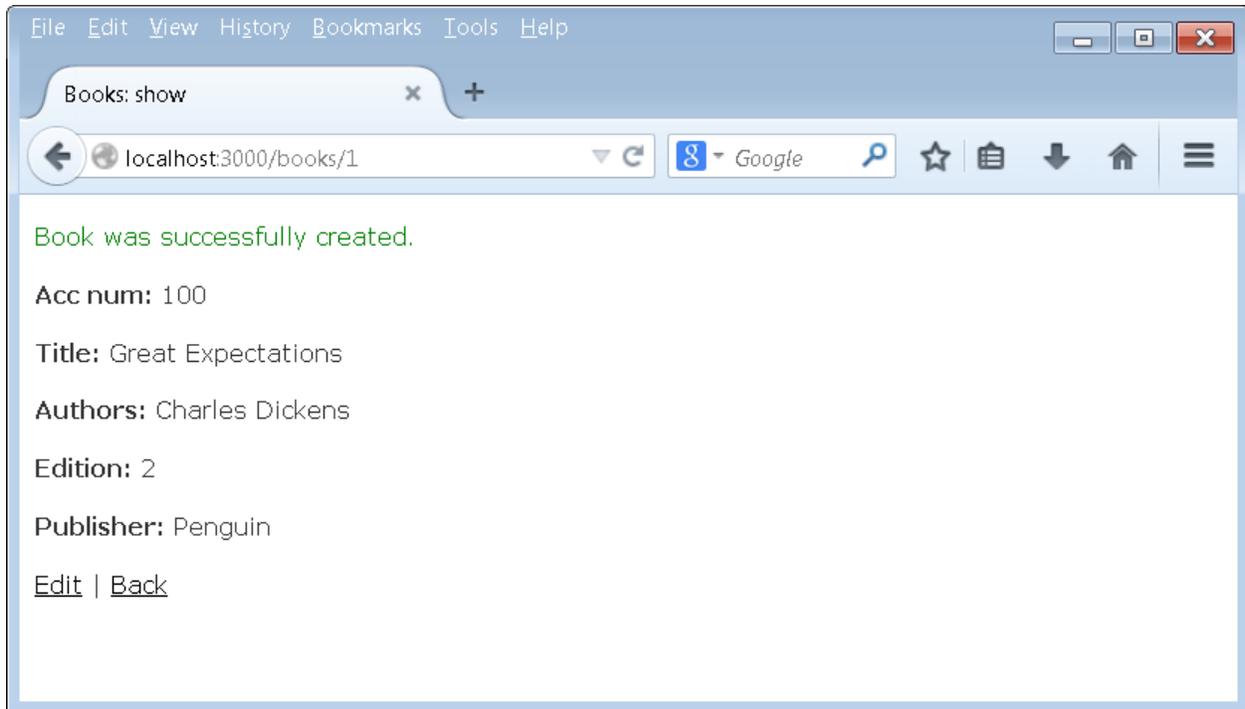

3. Open the application in browser to insert data into table books

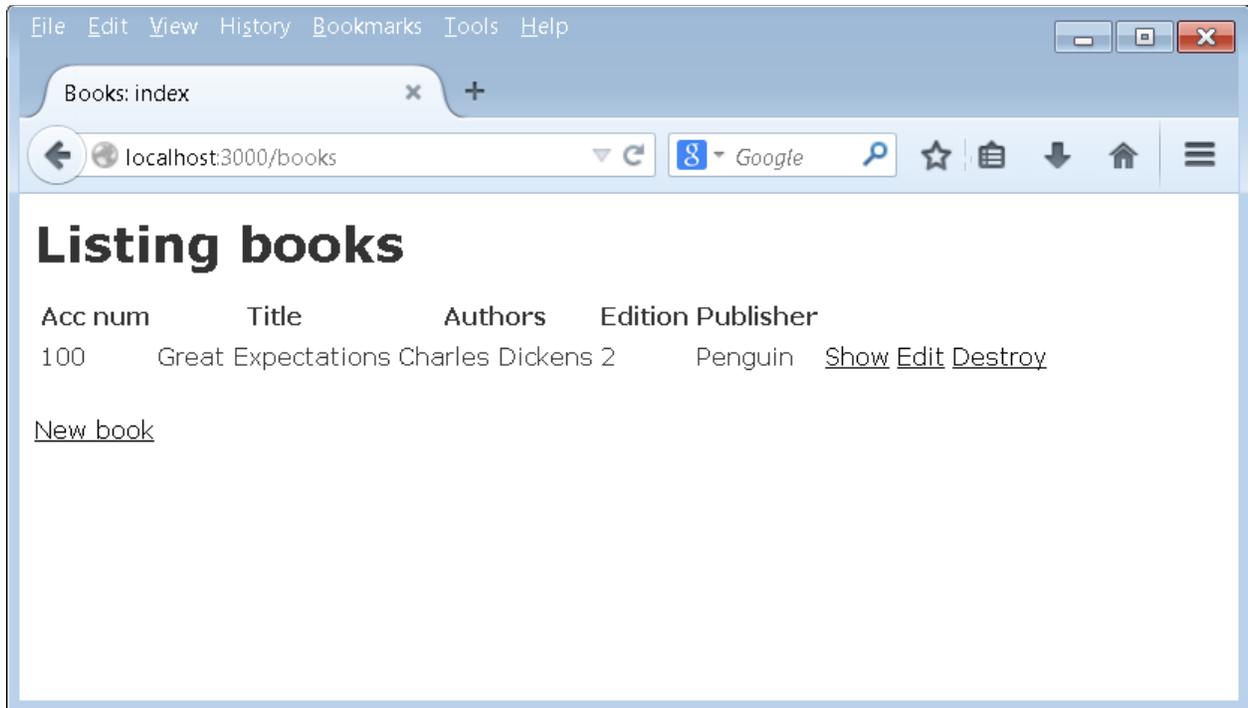

Click on the “New book” link to insert data into the table books

Click on Create

Click "Back" to see the listing

4. Create Views

Press control-c to stop the mongrel in command prompt and type

```
C:\InstantRails-2.0-win\rails_apps\bookApp> ruby script/generate controller main
```

This will create

```
main_controller.rb in C:\InstantRails-2.0-win\rails_apps\bookApp\app\controllers  
main folder in C:\InstantRails-2.0-win\rails_apps\bookApp\app\views
```

main_controller.rb

```
class MainController < ApplicationController
```

```
  def welcome
```

```
    @num_books = Book.count
```

```
  end
```

```
  def result
```

```
@bookid = params[:sid]

@bookz = Book.find(:all, :conditions => "id = #{@bookid}")

end

end
```

5. Generate model

At the command prompt type,

```
C:\InstantRails-2.0-win\rails_apps\bookApp> ruby script/generate model book
```

This will create **book.rb** in C:\InstantRails-2.0-win\rails_apps\bookApp\app\models directory.

6. Write rhtml pages to search for books.

Save the following two programs in **\bookApp\app\views\main** folder.

result.rhtml

```
<html>

<head>

<title> Welcome template for books </title>

</head>

<body bgcolor="#CCFFCC" text="#003800">

<h1>Welcome</h1>

<ul>

<li><a href="../books/new"> Add new book </a></li>

<li><a href="../books">View Book Listing</a></li>

</ul>

<h3> Search for books</h3>

<p> Total number of books : <%= @num_books %> </p>
```

```
<form action = "result" >
Enter title of book : <input type="text" name="sid" />
<input type=submit value="Search" />
</form>
</body>
</html>
```

result.rhtml

```
<html>
<head>
<title> Welcome template for books </title>
<style>
table {
border-collapse: collapse;
}
th {
background-color: #003300;
color: #CCCCCC;
}
th, td { padding: 5px; }
</style>
</head>
<body bgcolor="#CCFFCC" text="#003800">
<h1> Search Results </h1>
<p> Search Results for book title containing <b> <%= @booktitle %> </b></p>
```

[Back](welcome)

```
<table border="1">
```

```
<tr>
```

```
<th>Accession Number</th>
```

```
<th>Title</th>
```

```
<th>Authors</th>
```

```
<th>Edition No. </th>
```

```
<th> Publisher</th>
```

```
</tr>
```

```
<% @bookz.each do |bk|
```

```
@acc_num= bk.acc_num
```

```
@title = bk.title
```

```
@author = bk.authors
```

```
@edition = bk.edition
```

```
@publisher = bk.publisher %>
```

```
<tr>
```

```
<td> <%= @acc_num %></td>
```

```
<td><%= @title %> </td>
```

```
<td><%= @author %></td>
```

```
<td> <%= @edition %></td>
```

```
<td> <%= @publisher %></td>
```

```
</tr>
```

```
<% end %>
```

```
</table>
```

</body>

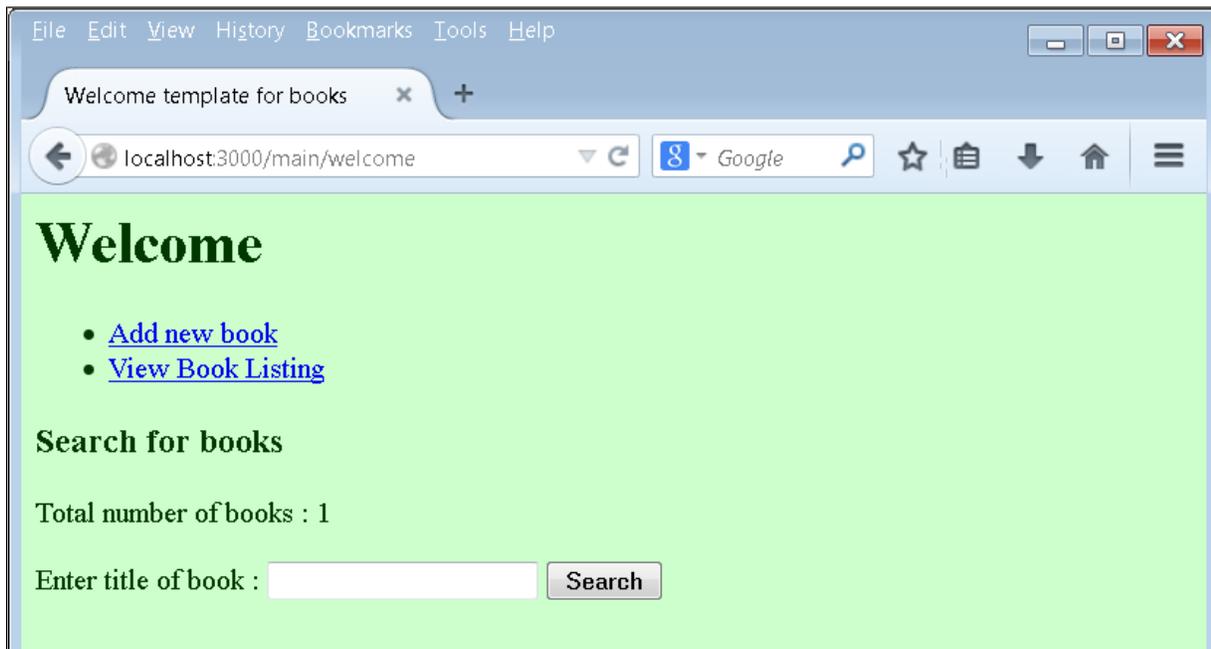

</html>

Start the application with mongrel

C:\InstantRails-2.0-win\rails_apps\bookApp> **ruby script/server**

7. Open the application in browser

Go to browser and execute, <http://localhost:3000/main/welcome>

The screenshot shows a web browser window with the following details:

- Menu: File, Edit, View, History, Bookmarks, Tools, Help
- Tab: Welcome template for books
- Address Bar: localhost:3000/main/result?sid=great
- Search Engine: Google
- Page Title: Search Results
- Text: Search Results for book title containing **great**
- Link: [Back](#)
- Table:

Accession Number	Title	Authors	Edition No.	Publisher
100	Great Expectations	Charles Dickens	2	Penguin
